1. Introduction

In this part of the project we are about to briefly analyze the project planning. Project planning is an important skilled part of the project management process. It is probably the most time consuming Pm activity, as it is mentioned in the lecture presentations from Mr. Nikas, it is a continuous activity from initial concept through to system delivery , it begins at the start of the project and does not really finish until the project is complete. Later on this assignment we are going to explain and analyze the project scope and the project objectives. We will separate the work in deliverable structure chart and afterwards in a deliverable definition table. The main part of this project is separating and setting the work packages and how work will be transmitted .Last but not least using the Microsoft Project program will help us present all the work packages and the time needed for the deliverables to be done.
